

Basic Idea

only events that made it into working memory.

• Attention: just the ordered items in the working memory.

There is still a possible difference between Interceptors & Processors:

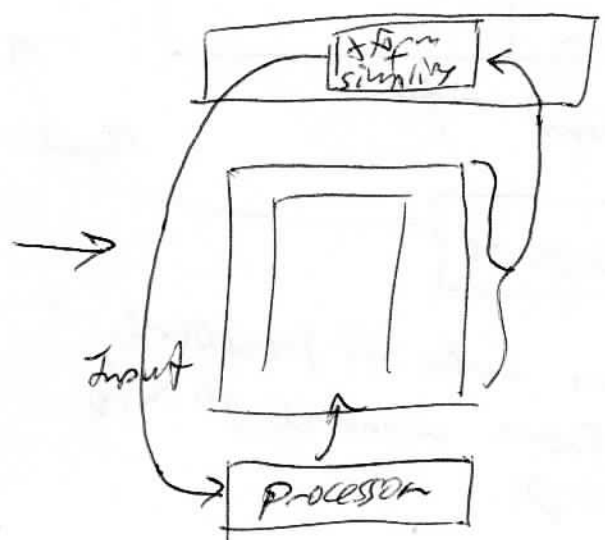

- Interceptors receive Events with ~~data~~ input data
- Processors are merely triggered by an event.

Q: Is it already filtered & simplified before storage in working memory?

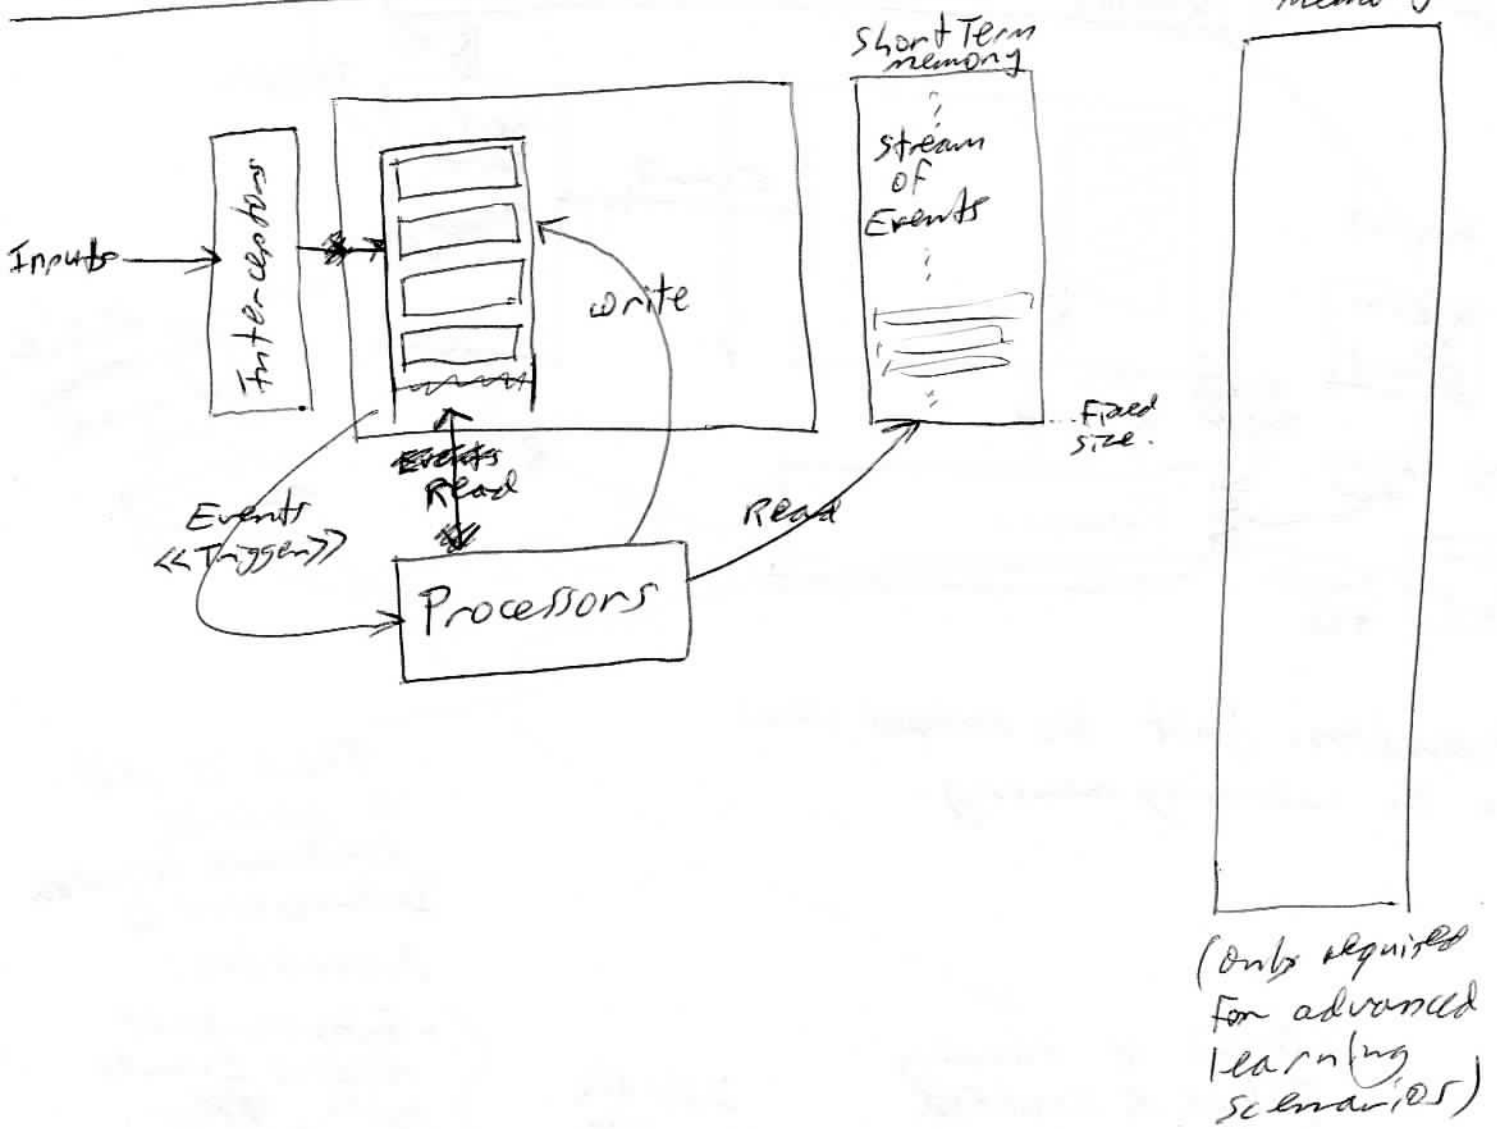

It's the big difference between a "sense" or not, (of which awareness of thought is a "sense").

conscious awareness is of:

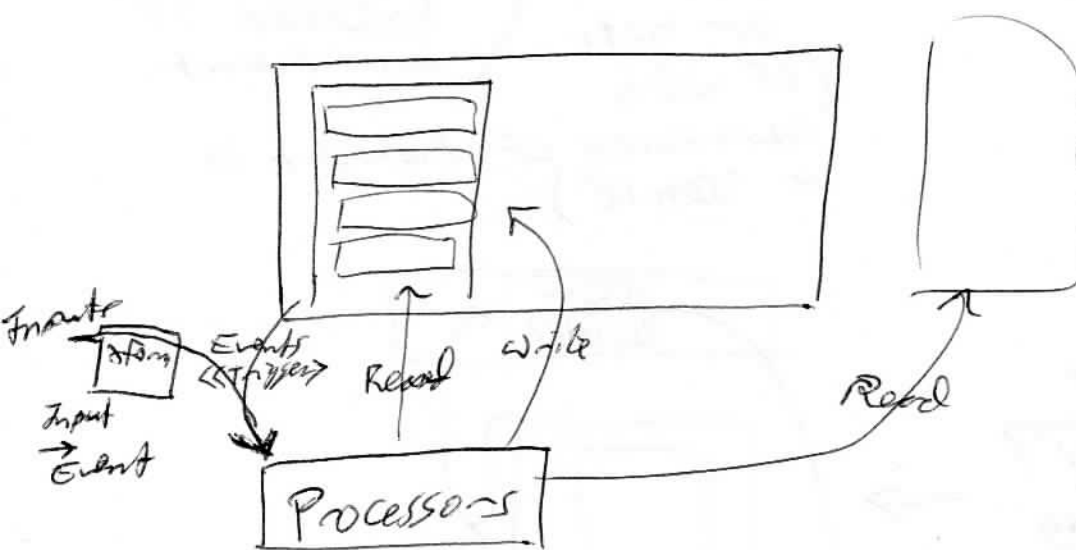

- current state of working memory.
- can only access short term memory by loading it into working memory.

4/ Basic Idea

OR Interceptors as Processors

All events run into all Processors, and output from winner(s) go into working memory.
