

Human Model

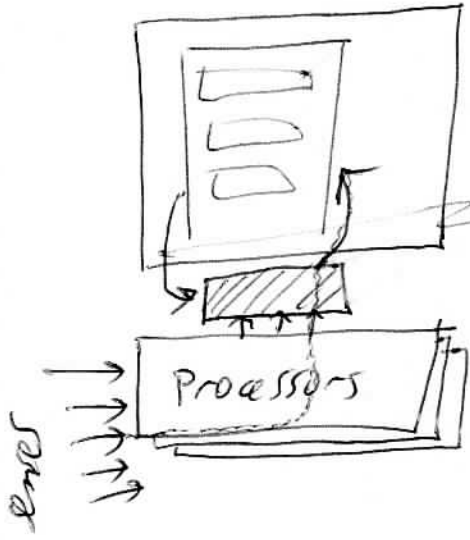

Human experience feels more like this:

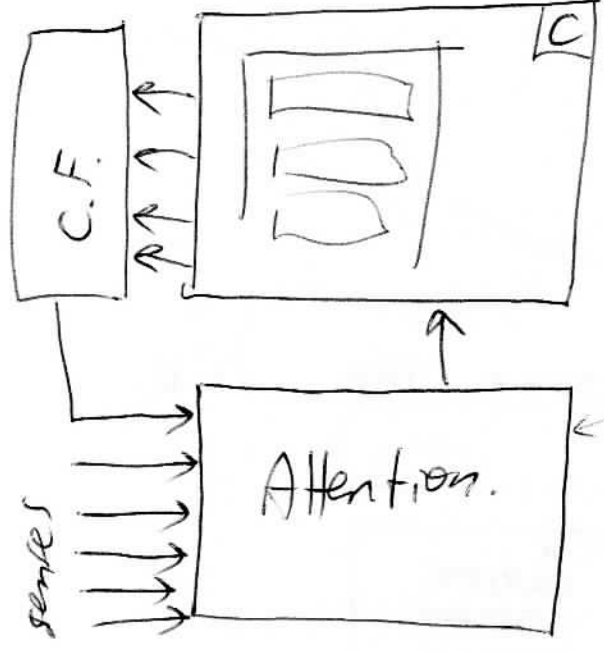

Human model

Need this effect:

uses current state of W.M. to help decide which processor output to bubble up.

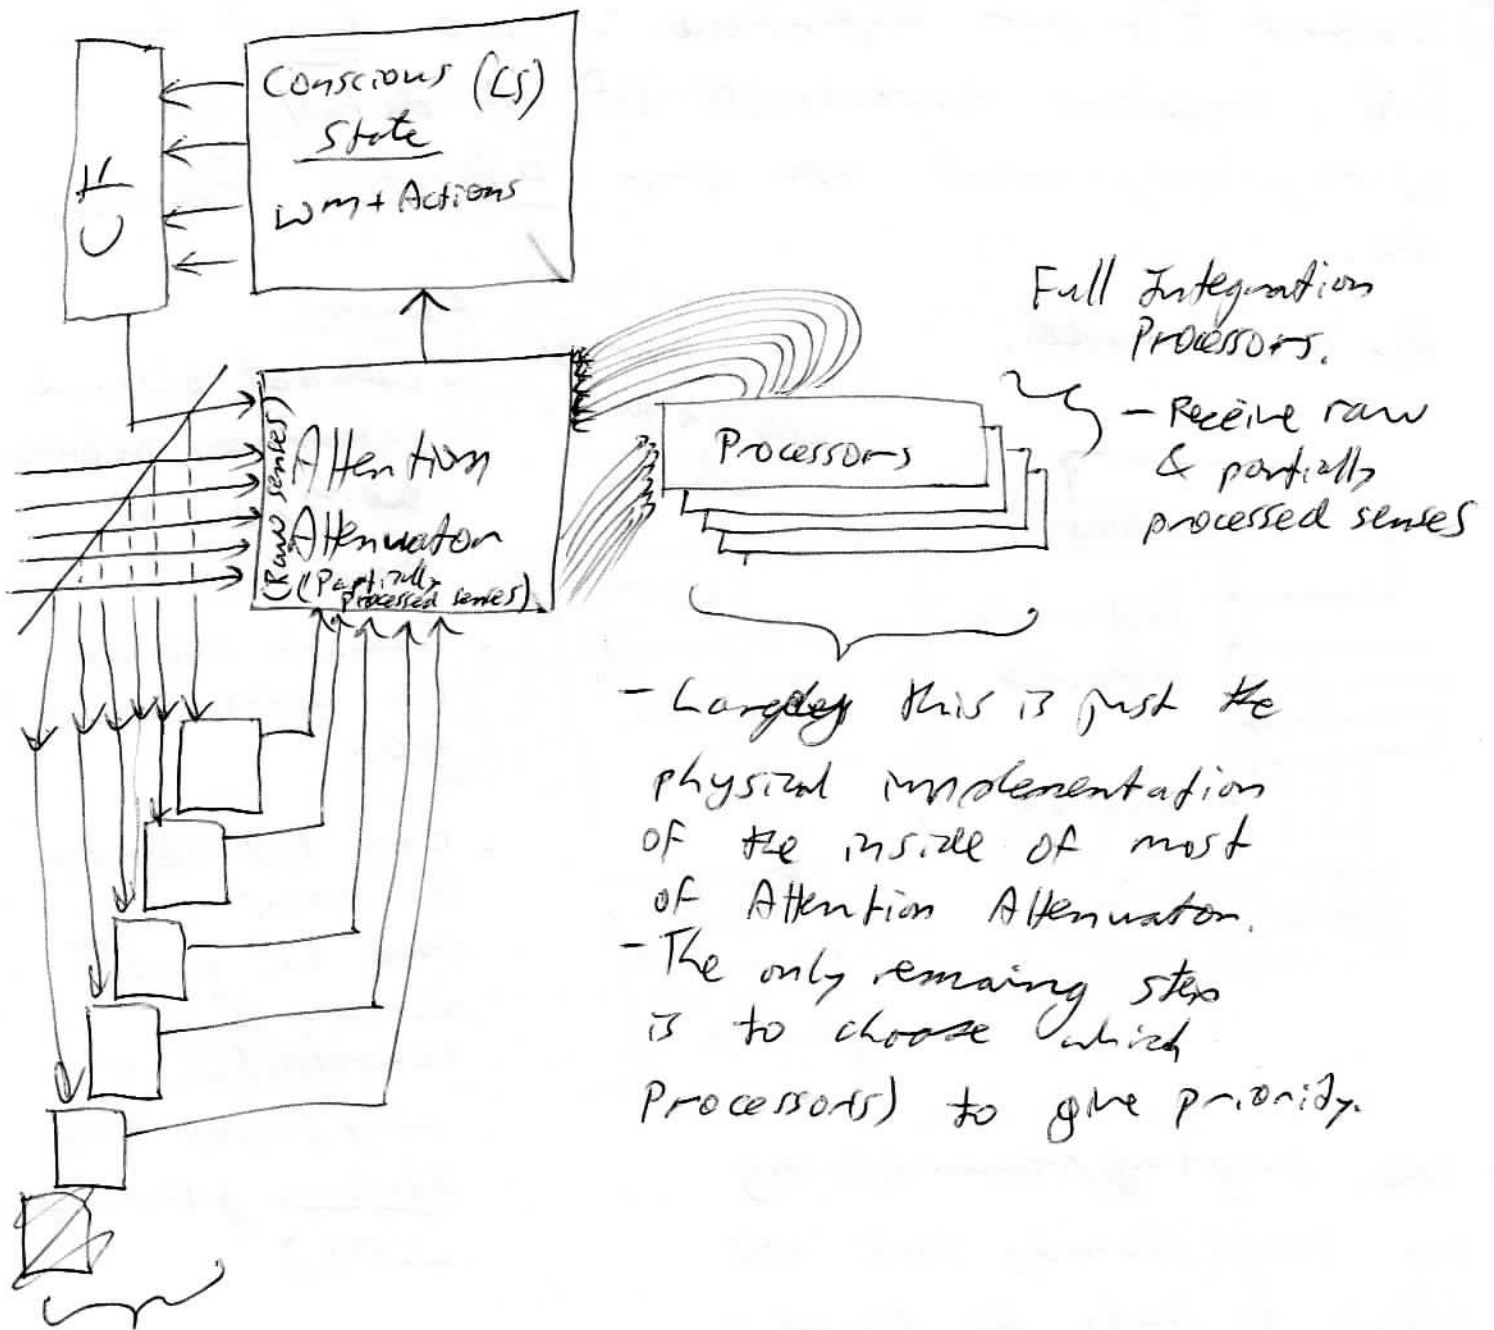

What can be done via this:

Basically the C.F. enables Attention unit to become sequential, in order to achieve sequential thought.

It's as if 'Attention' module is the seat of thinking and everything in W.M. (& other area within ~~W.M.~~ C) is just for state.

Human Model

Full Integration Processors.

- Receive raw & partially processed senses

- Largely this is just the physical implementation of the inside of most of Attention Attenuator.
- The only remaining step is to choose which Processors to give priority.

Interceptors:

- Look for specific events
- Extract features/objects
- ~~to~~ Raise alarms on some events
