

Solving Complex Problems - With Retries & Alternatives

strategy
Solving Processor.

- Needs to track attempts made so it can handle multiple alternatives.
- Also so it can handle nested Stuck Thought flags.

WM vs STM for Attempt ~~Problem~~ Data

- should be able to access immediately without needing to query STM everytime.
- But should be able to re-create from STM if missing from WM.
- Humans probably discard it pretty quickly when theres evidence an approach is working and only hold it in WM when doing tight iteration of multiple ~~at~~ alternatives.
- Also, impl. of this should probably be generic and capable of operating outside of the ^{related} solution strategy processor.
